

R122 | Behavior and neural decoding in five rats

12 recording sessions · 3,344 B1 trials · 3,319 B2 trials · independent analyses of public Gupta et al. data

A B1: primary contrast remains uncertain

B B2: heterogeneous and negative R^2

B1 primary gain: +0.019 [-0.032, +0.070]. Total control: +0.044 [+0.006, +0.083].

B1 intervals are descriptive across-rat t intervals ($n = 5$); sessions are averaged within rat. B2 points use the same aggregation.

Negative neural R^2 is below the target-mean reference. B2 uses trial-blocked CV, an explicit 100 ms lag, and causal smoothing.
